Dear Hiring Team,

Application for Full-Stack / Backend Software Engineer roles

I am a Full-Stack Software Engineer with 4+ years of experience building and operating production systems across backend services, frontend applications, payments, ERP workflows, CI/CD automation, and internal tooling. I am open to remote and onsite roles, and visa sponsorship is required. I am particularly interested in teams where strong ownership, practical engineering, and reliable product delivery matter.

At Marchtee.com, I have been a core contributor across five production repositories covering the storefront, checkout, ERP, infrastructure, and internal AI tooling. I rebuilt authentication flows with RBAC, OAuth 2.0, WebAuthn, multi-device sessions, and passwordless OTP, and built a single-page checkout with payment integrations including Cashfree and CCAvenue. The checkout work reduced checkout time by around 90% and improved conversion by up to 40%, while international checkout and logistics integrations helped support orders across 7+ countries.

I also independently built Waltra, an IoT-enabled water infrastructure monitoring platform for real-time visibility into tank levels, pump activity, flow readings, and device health. The project integrated legacy SCADA systems and Raspberry Pi field devices into a modern backend, replacing manual and cron-based syncs with near real-time ingestion, time-series pipelines, event detection, and mobile/web dashboards for operational teams.

Across these projects, I have worked through the kinds of challenges that matter in production: unclear requirements, no existing engineering structure, legacy systems, unreliable networks, inconsistent payloads, data integrity, payment failure handling, deployment safety, observability, and maintainability. I am comfortable owning features end-to-end, from architecture and database design to implementation, deployment, monitoring, and production support.

I would bring a combination of hands-on engineering depth, product judgment, and independent execution to your team. I enjoy building useful systems from the ground up, collaborating clearly across functions, and improving software in ways that create measurable operational and business impact.

Thank you for considering my application. I would be glad to discuss how my experience in full-stack engineering, international e-commerce, infrastructure, and IoT platforms could contribute to your team.

Kind regards,
Dhanesh Phulphagar
